

Securing the information in your Windows or Mac world has never been easier!

You think that it can't happen to you — but it could.

Your laptop could be stolen in the airport. There goes your proprietary client information. Think of what could happen if your data got into the wrong hands. Well, you can eliminate that fiasco by installing SecuriKey Professional Edition. With SecuriKey, no matter how long a thief has your laptop, your data remains untouched and the computer, unusable!

SecuriKey Professional

The SecuriKey System is based on security software and a small token that, when inserted into a computer's USB port, acts like a key that allows access for a specific user. And just like your car, no key – no go. Even if someone guesses the password, they will not be able to log in or access any data without the proper SecuriKey token.

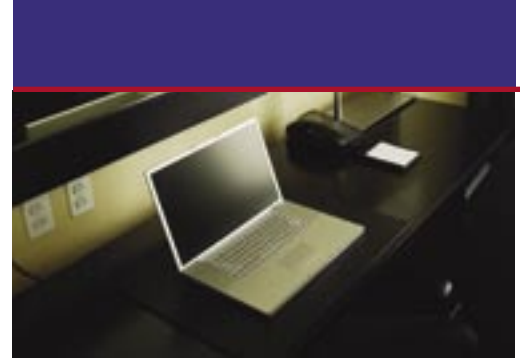

The SecuriKey System provides a solution that is easy to use, easy to manage, and highly affordable. Quick and easy installation makes it a breeze to install on multiple computers enabling you to secure your laptop, your office computer, and your system at home, all of your Windows PCs and Macs with just one package.

SecuriKey Multi-User Options

SecuriKey Professional Multi-User Edition brings full scalable support for multiple users to small offices, groups of laptops, and other shared computer environments. SecuriKey Professional Multi-User Edition works independent of the network configuration so it is a quick and dependable solution for data protection and regulatory compliance.

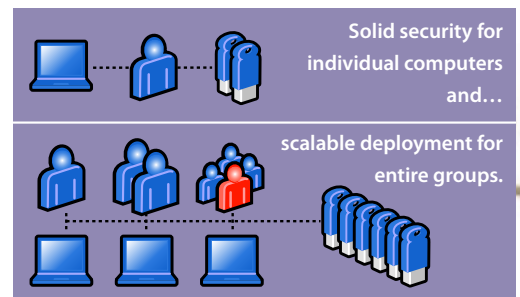

The SecuriKey Professional Multi-User Edition includes one complete copy of SecuriKey Professional Edition and any number of Multi-User Kits, depending on the number of people or computers you need to protect. Set up an administrator, then add a Multi-User Kit for each additional user.

You decide which people can access each different computer and what files they can access through the SecuriKey Protection Manager software. With flexibility to grow as your business grows, SecuriKey Professional Multi-User Edition is designed to grow with you. Adding additional users is a snap. Just purchase additional Multi-User Kits when you need them, and you can quickly configure access for the new people on your team.

System Requirements

Mac OS X v10.3
v10.4 (PPC or Intel)
Windows XP Home or Professional,
Windows 2000,
Windows 2003 Server
25 MB Free Disk Space
One Free USB Port

SecuriKey
PROFESSIONAL

Secured data... in the real world.

SecuriKey Professional is a two-factor user authentication system that brings powerful security tools to small and medium businesses. Authentication and security systems have traditionally been available to only the largest of companies requiring dedicated servers, intensive IT training and manpower for both deployment and maintenance.

Core to the SecuriKey solution is a combination of hardware and software for workstation access. A small USB token that contains custom ASIC encryption technology, along with a password, combine for workstation login.

Tokens, computers, and users can be configured for single or multiple access levels allowing for a wide range of configurations. Administrators can control the level of access, the degree of security and the ease of use for each user, for all users, and per individual workstations. Multiple security hardening options include protection from Windows Safe Mode attacks and government standard (FIPS-197) AES-based encryption when used with Windows XP Professional and Windows 2003 Server.

When the key is removed — access is restricted. The administrator can assign a number of responses to key removal including: computer shut down, user log off, or a simple switch back to the login window where all background applications and process activity continue to be active. Only access is denied... a perfect solution for file servers, or users with print queues or requiring continuous network access.

SecuriKey Multi-User Edition

Each Multi-User Kit includes a unique matched pair of SecuriKey USB Tokens, providing individualized identity and security.

Tremendous benefits

- Sensitive proprietary information is always protected
- Reduced risk of security breaches
- Eliminates the threat of identity theft
- Company secrets, medical records, and financial data are all safe
- You decide who has full access, limited access, or no access to your data
- A stolen PC no longer means stolen data — the data remains untouchable
- Time stamped logins/logouts for audit trail security
- Cross Platform
- Virtually unlimited expandability
- Add more protection as you add users
- Ideal for administrative server systems and laptop fleets

SecuriKey is the solution

- Provides Two-factor Authentication
- Solves Insider Abuse
- Solves Password Policy Problems
- Protects Data on Stolen Laptops
- Easy to Deploy
- Easy to Maintain
- Easy to Use
- Highly Cost Effective

Some thoughts regarding alternate authentication technologies...

PASSWORDS

For the most part, passwords come in two varieties, those that are too simple, and those that are hard to remember. Using our children's or pet's names are not advisable, worse yet listing them on a sticky note. The problem is not so much with passwords, but with how we use them. Two-factor authentication, something you know, and something you hold, has become the standard in the bank and ATM industry for just these reasons.

SMARTCARDS

For most people, and for most companies, Smartcards are not a viable solution. Setup and administration can be exhaustive and difficult. Smartcards also require a dedicated reader, an additional purchase that is expensive and can be especially clumsy on a laptop computers.

PKI SOLUTIONS

At 10% technology and 90% policy, PKI can be effective... once installed and implemented. For a very large corporation this may make sense, but for the 90 percent of employees that work in small to medium businesses it is just not a realistic solution.

PASSWORD REPLACEMENT

Available technology is often sold as a password replacement, hoping to get around the issues outlined above but is just as ineffective. Two-factor authentication significantly lessens the likelihood that intruders will penetrate your security measures.

ONE-TIME LOGINS

We all take breaks and leave our office unattended. One-time logins allow opportunities for undetected intrusion. A coffee break, lunch hour, or any other time you're away, your system and your information are at risk. With SecuriKey, you simply pull the token when you leave. Your computer can continue to check for Emails, print what is queued... and background applications continue to run. But, unauthorized access is denied.

BIOMETRICS

High-end systems that are truly effective can cost thousands of dollars per station. And the affordable solutions are still problematic. Cool as they are... they are best reserved for the big screen 'special agents'.

FINGERPRINT SCANNERS

The technology is improving, but false negatives that deny authorized access are still a problem. Stories of gummie bear and silly-putty break-ins are not exaggerated. Hand lotion and dirt can also hamper accurate readability. When this technology is both reliable, and affordable we will look to offer it as an option. In the meantime, SecuriKey offers a more reliable solution right now.

FLASH DRIVES

Hardware encryption, like that provided inside of the SecuriKey token, is a much stronger solution. Much of this 'freeware' only protects the information on the flash drive, leaving your hard drive and data accessible.

BACK DOORS

If your security solution is hardware (fingerprint readers, flash drives, etc.) and comes with only one unit, then there is likely a back door. Typically the back door is the same for everyone. SecuriKey Pro comes with two keys, so that if something happens... you lose your main key... you still have a back up. And, as long as you have registered, we store enough information and can generally ship a replacement key to you that day!
