

James | IT manager

When James first started his job, he and his boss spent more than half of their time reconfiguring computers. When James took over he made a couple of changes. He bought a single copy SecuriKey. He installed it on each of his 4 file servers. This keeps unauthorized access in check... but allows the servers to keep on working.

Additionally James maintains about 120 computers in the building. 40 of those are for public access. He secures the administrative functions on all those computers with a single installation of SecuriKey Professional.

James has been able to reduce staff and add capabilities to the network.

SecuriKey
PROFESSIONAL

key Issues for James:

His servers are fully secured... but continue to run.

He no longer worries about the public computers being tampered with.

His time to fix user configuration errors has dropped dramatically.

"I used to spend most of my time undoing what students would do for fun, or fixing the professor's computers. Between the hackers and the computer phobic... it was really inefficient."
